ARTICLE INFO

ABSTRACT

Present investigation conducted to check the mediation effect of customer satisfaction between promotion mix elements and customer buying behavior in education sector of Ethiopia. The researchers employed mixed method research strategy and cross sectional sequential explanatory research design. In addition to this, archival data was collected from the educational universities public relation offices. Sampling method used was purposive and simple random sampling to get the sample from the targeted population. Lastly, AMOS version 26 and SPSS vs22 were used for data analysis. The Kaiser-Meyer-Olkin test was used to measure of sampling Adequacy. Mahalanobis' distance (MD) as a statistical measure based on a chi-square distribution was employed to check the extent to which cases are adjusted with multivariate outliers. SEM model fitness results showed the complete mediation i.e the entire (or total) effect of Promotion Mix Elements on a Customer Buying Behavior is transmitted through Customer Satisfaction. Thus, the Promotion Mix Elements have no direct effect on the Customer Buying Behavior; rather, its entire effect is indirect. Thus, mediation role of Customer Satisfaction was really happening in a given model, but the total effect is significant simply because the sample size is very large, or assumptions for the test of the total effect were met.

INTRODUCTION

Promotional elements usually are used by various organizations. Marketers use numerous tools to elicit responses from target markets. These tools are known as the marketing mix, which is defined as the set of tools that a firm uses to pursue its marketing objectives in the target market (Kotler, 2017). Every business uses a combination of one or more promotional mix elements to achieve high performance. These promotional mix elements are advertising, sales promotion, personal selling, public relation and direct marketing (Belch & Belch, 2018). Of all the marketing tools, advertisement is an effective way to influence the mind of viewers and gives viewers” exposure towards a particular product or service (Katke, 2018). Aaker (2016) defined promotional mix as —any marketing effort whose function is to inform or persuades actual or potential consumers about the merit a product possess for the purpose of inducing a consumer to either start buying or continue to purchases the firm’s product.
According to Drucker (2012) adopting a good and effective promotional strategy is very important for any business without a best promotional strategy; a business will not be able to get the ideal customers for its services and goods. This research paper will analyze the effect of promotional strategies on Customers’ buying behavior in the case of education sector of Ethiopia. In addition, in selecting appropriate promotional mix, the financial institutions must consider the target audience, the stage of the products, life cycle, characteristics of the products, and decision stages of the products and the channel of distribution (Kotler, 2000). This study therefore, seeks to evaluate the mediation effect of customer satisfaction between promotion mix elements and customer buying behavior in education sector of Ethiopia.

**STATEMENT OF PROBLEM:**

Bintu (2017) researched on effects of Marketing Strategy on profitability of Small-Scale Businesses in Maiduguri Metropolitan, Borno State Nigeria. Saguti (2018) researched on the effect of marketing strategy (4Ps) on sales performance of Tigo Telecommunication Company. Findings revealed that marketing mix affects sales promotion in inverse manner. But Muthengi (2018) research on the effect of marketing strategies on sales performance of commercial banks and found out that marketing mix enhances sales performance in a positive manner. Munyole (2018) carried out research on marketing strategies adopted by veterinary pharmaceutical firms helps to enhance performance and he found out that marketing strategies improve performance. Muchengi (2018) conducted research on the effects of marketing strategies on sales of Commercial Banks revealed the opposite results. Muchengi (2018) conducted a study on marketing strategies to enhance competitiveness. The results revealed that there is a strong positive relationship between marketing strategies and competitiveness. Although several studies conducted in the past highlighted the importance of marketing strategy and its impacts on an organization’s performance. But, none of these studies was designed with respect to ascertaining the impact of the four marketing Ps on the customer buying behavior.

Yang, D. J., & Lee, C. W. (2016) conducted their study on marketing strategy and the effects on female consumer buying decisions in relation to cosmetic products and found a positive relation between marketing strategy strategies on organizational profitability. Sales promotion is one of the essential parts of a marketing strategy. Khan et. al., (2019) study tests the impact of various marketing strategies and its impact of organizational profitability and found a positive relation between marketing strategies on organizational profitability.

Ibrahim et. al. (2018) studied that marketing strategy was used to communicate with consumers at alluring cost without convey it to customer too generate sales and profit. This research found a positive relation between marketing strategies on organizational profitability.

Paguntalan (2020) research used the descriptive study design to identify the effect of marketing strategy strategies on organizational profitability. This study manifested that in first stage because of marketing strategy strategies, organizational profitability was positively affected but after a certain time organizational profitability was negatively affected. It showed an inverted U shaped relation. Liu et. al., (2020) study depicted that marketing strategy strategies were negatively related to consumers’ purchase behavior. Shaw & Bagozz (2018) study depicted that marketing strategy strategies were negatively correlated with rational choice attributions of organizational profitability. Marketing strategy can dramatically influence consumer perceptions and ultimately the success of a marketing strategy. Jang & Moutinho (2019) researched how price promotion influences actual consumer spending.

Price promotion negatively influences consumer spending. Thus found that marketing strategy strategies were negatively correlated with balanced preference attributions of organizational profitability. Therefore on base of above studies contradictory evidences are found in study the effect of marketing strategy strategies on organizational profitability. Thus to fill this evidence gap researcher want to conduct this present research.

In addition, while most these studies focused on the impact of marketing strategies on the sales performance, competitiveness, and profitability of organizations in the telecommunication industry, banking industry, etc. none to the best of the researcher’s knowledge had examine this impact with reference to the education industry in Ethiopia to be specific, thereby creating a research gap. Also no study will be conducted with mediation effect of customer satisfaction between promotion mix elements and customer buying behavior in education sector of Ethiopia. It based on the foregoing that this study seeks to examine the mediation effect of...
customer satisfaction between promotion mix elements and customer buying behavior in education sector of Ethiopia

SPECIFIC OBJECTIVES OF THE STUDY
To identify the major Promotion mix elements followed by the Education sector of Ethiopia to affect the customer buying behavior.
To determine the effect of Promotion mix elements on customer buying behavior.
To find the mediation role of Customer satisfaction in between Promotion mix elements and customer buying behavior.

MODEL SPECIFICATION:

Source: Researchers’ Own Framework (2022)

RESEARCH METHODOLOGY
A research methodology is a procedural framework to solve systematically identified research problem (Mohamed Shaffril et al., 2021). The researcher was employ mixed method research strategy and cross sectional sequential explanatory research design. In addition to this, archival data was collected from the educational universities public relation offices including annual reports, conference & seminar reports to get necessary information. Sampling method was used to purposive and simple random sampling get the sample from the targeted population. Quantitative data was collected from survey a questionnaire that was conducted with the educational universities public relation offices members and also through Observation. Lastly, AMOS version 26 and SPSS vs22 was used for data analysis. Since, SPSS and AMOS are statistical package that are powerful & easy to use. Moreover, it is complete, integrated statistical package that used for data analysis, data management, and graphics especially for handling large scale of data.

RESULT AND ANALYSIS
KMO is a test conducted to examine the strength of the partial correlation (how the factors explain each other) between the variables. This table shows two tests that indicate the suitability of your data for structure detection. The Kaiser-Meyer-Olkin Measure of Sampling Adequacy is a statistic that indicates the proportion of variance in your variables that might be caused by underlying factors.

Table. 1. Measure Of Sampling Adequacy (Bartlett's Test Of Sphericity) Table 1: Kaiser-Meyer-Olkin And Bartlett's Test

<table>
<thead>

</tbody>
</table>
Extraction Method: Principal Component Analysis

The KMO and Bartlett test evaluate all available data together. A KMO value over 0.5 and a significance level for the Bartlett's test below 0.05 suggest there is substantial correlation in the data. Variable collinearity indicates how strongly a single variable is correlated with other variables.

a. Dependent Variable: Customer Buying Behaviour

Mahalanobis' distance (MD) is a statistical measure of the extent to which cases are multivariate outliers, based on a chi-square distribution, assessed using p < .001. The critical chi-square values for 2 to 10 degrees of freedom at a critical alpha of 0.001 as shown in above table indicated a good fit. The Cook's distance shown in above table, considered high as it is greater than 0.5 and extreme. It is greater than 1. As the point has been flagged by the Cook's distance, this point is considered highly influential and has a combination of unusual explanatory variables and response values (the combination of Xi's and yi are unusual).
STRUCTURAL EQUATION MODEL (SEM)

As a multivariate statistical analysis technique, the above figure in the form of structural equation modeling shows the structural relationships among variables. SEM combined the factor analysis and multiple regression analysis, and it is shown that the structural relationship between measured variables and latent constructs was under acceptance.

Table 3: REGRESSION WEIGHTS: (GROUP NUMBER 1 - DEFAULT MODEL)

Source: AMOS output (2022)

The above table results manifested that the p value is below 0.05, therefore, regression weights and the correlations are independent of the units in which all variables are measured; therefore, they are not affected by the choice of identification constraints.

1.10. INTERPRETATION OF MODEL FIT

This model fit sheet summarizes the result of SEM model fitness with their accepted values.

Source: AMOS output (2022)

As seen in above table 4, the model fit sheet summarizes the result of SEM model fitness with their accepted values. When researchers compare the SEM model fit indices with the standardized vales, it was observed that Chi-Square (CMIN), Goodness of Fit Index (GFI), Baseline Comparisons in Model Fit, Parsimony-Adjusted Measures, Root Mean Square Error of Approximation (RMSEA), Standardized Root Mean Squared Residual, Comparative Fit Index and Critical N all are under acceptance range and depicted the model fitness.

Table 5: Total Effect

<table>
<thead>
<tr>

</tr>
<tr>
<td>Customer Buying Behavior</td>
<td>.480</td>
<td>.207</td>
<td>.000</td>
</tr>
</tbody>
</table>

Source: AMOS output (2022)

Researcher mediator model based on Customer Satisfaction mediation, decomposes the total effect, \( c \), into the indirect effect, \( ab \) (product of the indirect paths a and b) and the direct effect, \( c' \) (with the effect of the mediator removed). The total effect can be describes as \( c = c' + ab \), and hence the indirect effect as \( ab = c - c' \). With complete mediation, the entire (or total) effect of Promotion Mix Elements on a Customer Buying Behavior is transmitted through Customer Satisfaction as a mediator variable. Thus, the Promotion Mix Elements has no direct effect on the Customer Buying Behavior; rather, its entire effect is indirect. Thus, mediation role of Customer Satisfaction was really happening in a given model, but the total effect is significant simply because the sample size is very large, or assumptions for the test of the total effect were met.
CONCLUSION
The purpose of this study was to investigate the effect of promotion mix elements on consumers buying behavior. To achieve the purpose of the study three basic research questions were proposed to investigate the effect of promotion mix elements on consumers buying behavior and to answer the stated basic questions. From the findings of the study it can be concluded that the entire research objective for this study was attained; the general objective of this study was to examine the effect of Promotion mix elements on customer buying behavior: Selected promotion mix elements have significant effect on customers buying behavior. With complete mediation, the entire (or total) effect of Promotion Mix Elements on a Customer Buying Behavior is transmitted through Customer Satisfaction as a mediator variable. Thus, the Promotion Mix Elements has no direct effect on the Customer Buying Behavior; rather, its entire effect is indirect. Thus, mediation role of Customer Satisfaction was really happening in a given model, but the total effect is significant simply because the sample size is very large, or assumptions for the test of the total effect were met. Moreover, based on the findings from the regression analysis, the researcher concluded that, those tools have a positive association with the buying behavior of customers. Based on the quantitative research analysis finding, all the five elements of promotion mix have their own impacts for the customer buying behavior.
